

Explanatory Note.

At the recent Congress of the A. O. U. in Cambridge the author's attention was called to some parts of the introduction to 'Birds of California,' which have created a wrong impression concerning the work, among those lacking time to investigate the matter. Hence, it seems best to state definitely that *the book* is not the result of one season's reconnaissance in the field; it is based upon the author's own field notes, begun in October, 1894, and continued, with few interruptions, until July, 1902.

These years of data gathering *in the field* were supplemented by two years' work upon the text.

The "test study" refers only to the last five months, which were spent, as stated, in ascertaining so far as possible what birds were *most commonly* met with by the casual observer. The list of places where observations were made includes all places visited during the eight years mentioned, and does not refer alone to the last trip.

Also, the word "cases" on page 13 is used as synonymous with "instances," the specific meaning intended being "broods."

When Mr. F. M. Chapman, in reviewing the book in 'Bird Lore,' interpreted 'cases' as 'species,' the author was appalled and at once wrote to Mr. Chapman, asking that this error be corrected in the next issue. Owing to Mr. Chapman's absence in the Bahamas, the letter failed to reach him and the correction was not made.

GENERAL NOTES.

Sabine's Gull in Montana.—I enclose two photographs of an immature example of Sabine's Gull (*Xema sabinii*), which, as far as I know, has not before been recorded from Montana. This bird was shot September 23, on the Yellowstone, by the ferryman at Terry, who told me that on the previous day he had seen about fifty gulls, all resting on the river shore—the flock including this species and others slightly larger. I presumed the larger gulls to be Ring-billed Gulls, which, as well as American Herring Gulls, I have observed on the Yellowstone at different dates.

The specimen is a male. The dimensions in inches are: Length to end of tail, 13; to end of wings, 14; extent, 30; wing, 10; tail, 5; across fork of tail, 1½; bill, along gape, 1½. The bill was black; legs and feet flesh color; irides dark brown.—E. S. CAMERON, *Terry, Montana.*

Additional Record of the European Widgeon (*Marcca penelope*).—I have recently examined a fine adult male of this species, which was shot on an overflowed meadow near Nippersink Lake, Lake County, Ill., on April 1, 1904, by Mr. Charles Muehrcke, and is now in his possession. The bird was in company with six of his American cousins, all of whom were shot. The specimen is mounted representing dead game. This record makes the eighteenth for the interior.—RUTHVEN DEANE, *Chicago, Ill.*

Little Blue Heron in Connecticut.—A flock of Little Blue Herons (*Florida cærulea*), all young in the white plumage, made its headquarters
